

Cardiovascular Disease

What is Cardiovascular Disease (CVD)

► Define CVD :

are one of the leading causes of death worldwide, according to the World Health Organization. They are a group of disorders and diseases that affect the heart and blood vessels due to blockage, preventing enough blood from reaching the heart, brain, or any other part of the body. They are linked to the accumulation of fatty deposits in the Arteries, which is known as atherosclerosis.

Types of Cardiovascular Diseases

- ▶ 1. Coronary heart disease: These are diseases that affect the blood vessels that supply the heart muscle. It occurs when blood flow to the heart is blocked, which can result in what is known as .angina, heart attack, or heart failure.
- ▶ 2. Cerebrovascular diseases: These are diseases that affect the vessels that feed the brain.
- ▶ 3. Peripheral arterial disease: affects the blood vessels that supply the arms and legs, and occurs when there is a blockage in the arteries of the extremities.

Types of Cardiovascular Diseases

- ▶ 4. .Congenital heart diseases: These are abnormalities in the heart structure at birth .
- ▶ 5. Rheumatic heart disease: is damage to the heart muscle and heart valves resulting from rheumatic fever.
- ▶ 6. Deep vein thrombosis or pulmonary embolism: blood clots that appear in the veins of the legs and .can travel to the heart and lungs .

Causes and Risk Factors

- ▶ Non-modifiable risk factors :
 - ▶ 1. The genetic factor: as having a family history of the disease means an increased risk of developing cardiovascular disease.
 - ▶ 2. Age : The risk of developing cardiovascular disease increases as we get older.
 - ▶ Gender as men: are more susceptible to infection at a younger age, but after menopause, the risk of infection is equal between the sexes .

Causes and Risk Factors

- ▶ modifiable risk factors :
 - ▶ 1. Obesity and overweight: The risk of developing heart disease increases the higher the body mass index .
 - ▶ 2. Anxiety and stress: Depression, life stress, loneliness, and lack of social relationships are all factors that increase the development of cardiovascular diseases, especially coronary heart disease.
 - ▶ 3. High cholesterol and triglycerides: The fatty substance in the blood can increase the chance of developing a blood clot.

Causes and Risk Factors

- ▶ modifiable risk factors :
- ▶ 4. Diabetes: High blood sugar causes deterioration of small and large arteries, and as the years pass and the sugar level is not controlled, the cells in the inner walls of the arteries are unable to reproduce as required, which leads to atherosclerosis .
- ▶ 5. Smoking: reduces the oxygen in the blood, increases blood pressure and heart rate, and then the heart is forced to work harder to provide a sufficient amount of oxygen to the body.

Signs and Symptoms of (CVD)

► List common symptoms :

1. Chest pain or discomfort .
2. Shortness of breath .
3. Fatigue .
4. Dizziness .
5. Palpitations .

(Highlight that some people may be asymptomatic)

Diagnosis of CVD

- ▶ 1. Physical exams .
- ▶ 2. Blood tests .
- ▶ 3. Electrocardiogram (ECG).
- ▶ 4. Echocardiogram .
- ▶ 5. Exercise stress test .
- ▶ 6. Cardiac catheterization .

Prevention of CVD

- ▶ Lifestyle modifications :
 1. Healthy diet .
 2. Regular exercise .
 3. Smoking cessation .
 4. Limiting alcohol intake .

- ▶ Medications as prescribed by healthcare professionals.

Treatment of CVD :

COMMON TREATMENTS FOR HEART DISEASE

STATINS

These cholesterol-lowering drugs can reduce the level of plaque-forming LDLs in your bloodstream. The big benefit? They can lower the risk of heart attack by up to 25%.

BLOOD THINNERS

Also known as anti-coagulants, these meds help prevent the formation of dangerous blood clots in your arteries, which could block blood flow.

BETA BLOCKERS

These pack a double-punch: They not only lower your blood pressure but they can also reduce your heart rate, which means your ticker doesn't need as much oxygen.

LIFESTYLE CHANGES

While medications are helpful, don't lose sight of the power healthier habits. Improving your diet, exercising more, and giving up smoking are essential, too.

Importance of Early Detection :

- Emphasize the role of regular check-ups and screenings .
- Early detection and intervention can prevent complications .
